

# PRE - TAR - TREATMENT

**Pre-Tar-Treatment** is our patented trade mark and a unique method that we have developed to pre-treat outdoor panel that later will be painted with tar paints. The advantage of Pre Tar Treatment is that it is completely odorless and dry. Thus, it makes it possible for house builders to panel inside their factory. It is recommended to apply the final tar paint as soon as the house is finished, but at the latest within three years. Final painting should be applied during painting season Apr - Sep, when the temperature does not fall below 10 degrees.

VI GER ER: **PRE - TAR - TREATMENT**  
LUKTFRI & TORR FÖRBEHANDLING  
NI ERBJUDER KUNDER:  
TRENDIGA FASADFÄRGER

**Pre - Tar - Treatment** is a diffusion open transparent glaze in its basic design. It is pigmented with desired color that matches the final shade of the panels. The treatment gives the necessary protection against mold. We work closely together with Auson the producer of Tar the colors.

## Surface treatment process

According to new directives for the wood industry (Boverket's Building Regulations BBR), wood must be retained fire class D for all industrial surface treatment. This is why we at Svensk Trälackering have developed this very simple, flexible and cost-effective method that retain fire class D. Below we show the Pre-Tar - Treatment approach.

One coating with PRE - TAR - TREATENT and one with Tar Paint correspond to two coats with tar paint in quality / durability but is significantly lower in price.
